

Fledge: Edge-based Federated Learning Framework for Mobile Healthcare

Presented By: Prithish Mishra

Fledge Framework

- 1 Initialise local models
- 2 Train model with local data
- 3 Transfer model weights

Edge Client 1

Edge Client 2

Edge Client n

Fledge Framework

- 1 Initialise local models
- 2 Train model with local data
- 3 Transfer model weights
- 4 Aggregate model weights
- 5 Transfer new model weights
- 6 Apply new model weights

Edge Client 1

Edge Client 2

Edge Client n

Fledge Framework : Key Features

- ① **Generic:** Provides support for any ML model uploaded by model/application developer.
- ② **Real-world Deployment:** Deployment environment supports actual edge devices on real-world infrastructure, rather than only simulated mode.
- ③ **Resource Awareness:** Framework must split the model intelligently between available resources to ensure good resource utilisation and accuracy.

Existing Federated Learning Frameworks

- ◎ FATE
- ◎ PaddleFL (PFL)
- ◎ TensorFlow Federated (TFF)
- ◎ PySyft
- ◎ IBM Federated Learning

The logo for FATE (Federated Analytics Trusted Execution) is displayed in a large, bold, yellow font with a slight 3D effect and a shadow.

Federated Learning 

Prior Work in ML Healthcare

- ◎ “FEEL: A Federated Edge Learning System for Efficient and Privacy-Preserving Mobile Healthcare”
- ◎ Proposes splitting of model to manage resource consumption
- ◎ Just a proof-of-concept of the splitting idea, no algorithm proposed for a generic framework

Why Federated Learning for ML Healthcare?

- ◎ Proliferation of data collection points - smart wearables, electronic health records, personal health monitors
- ◎ Centralised processing of all information
- ◎ Privacy-sensitiveness of data
- ◎ Data ownership
- ◎ Complexity of ML models

Research Questions

- ◎ RQ1: Can the federated mode of the framework provide similar accuracy as centralised mode? (Accuracy vs Privacy)
- ◎ RQ2: Does the federated mode of the framework add any extra overheads on performance? (Training time, Communication latency, Processing overheads)
- ◎ RQ3: Can we design an algorithm that splits any given ML model to maintain good resource consumption and accuracy?

Perf Eval - Dataset

- ① MNIST Dataset: Images of handwritten numbers from 0-9.
No. of datapoints: 70,000 images
- ① Breast Cancer Dataset: Multiple features of patient with cancer diagnosis - malignant or benign
No. of datapoints: 648
No. of features: 9

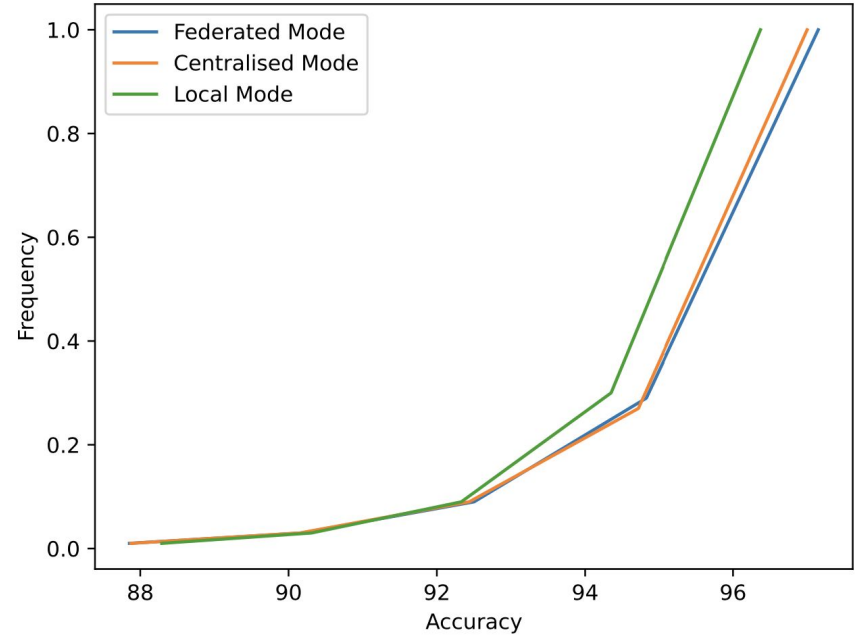

Perf Eval - Candidates

- ① Centralised Mode: Data collected from all clients available at the centralised server to train a global model.
- ① Local Mode: Each client has its own local data and local ML model to train.
- ① Federated Mode: Each client uses its own local data to train a globally distributed and aggregated model. Model params aggregated using FedAvg algorithm.

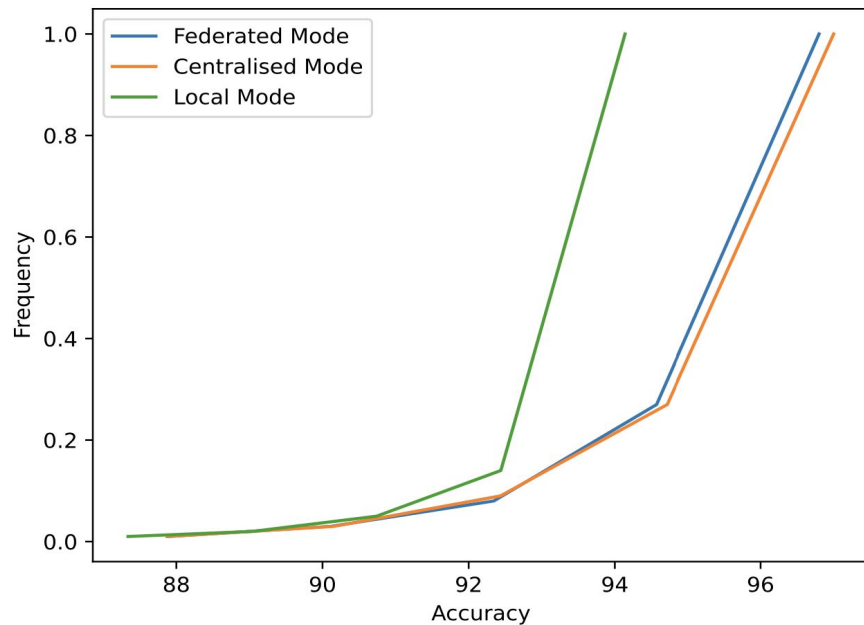

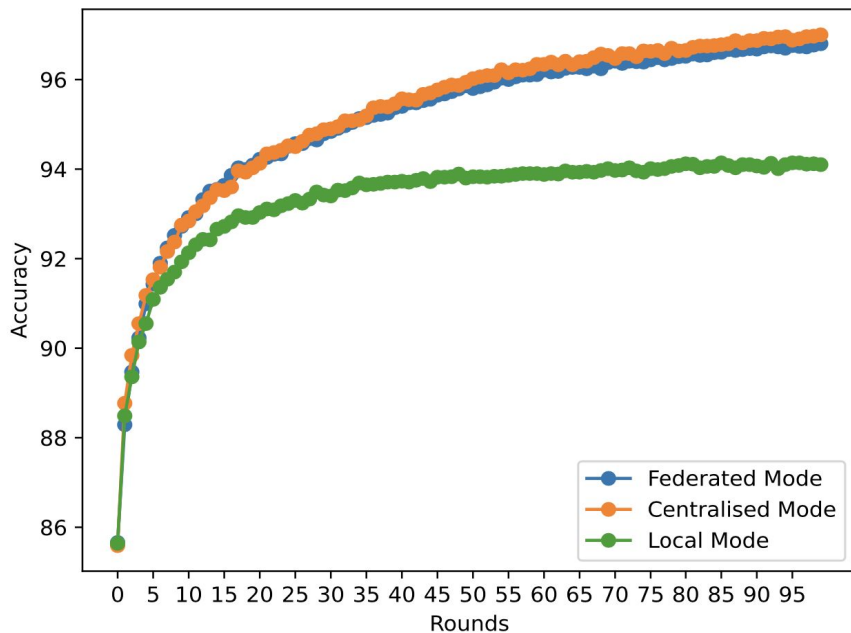

Perf Eval - Infra

- ◎ Server Node (Cloud):
 - CPU: 3.1Gz @ Intel Xeon® Platinum 8175M
 - Memory: 16 GB
 - Cores: 4
- ◎ Client Node (Edge):
 - CPU: AWS Graviton Processor
 - Memory: 8 GB
 - Cores: 1

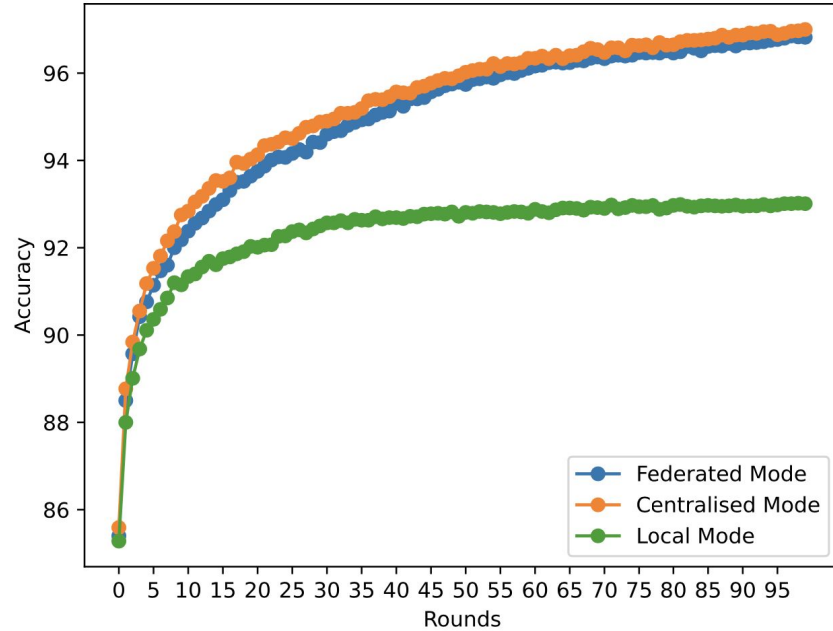

Performance Evaluation: Accuracy

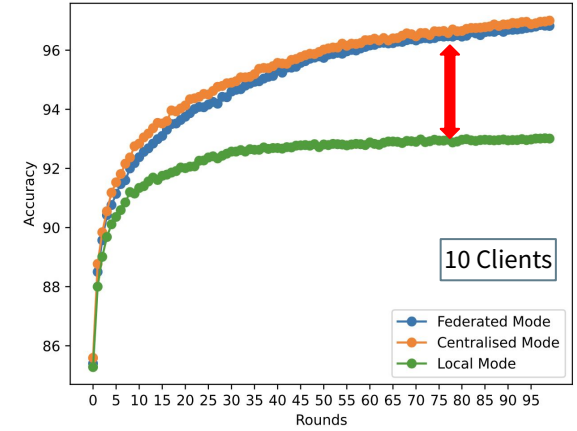

Performance Evaluation: Accuracy

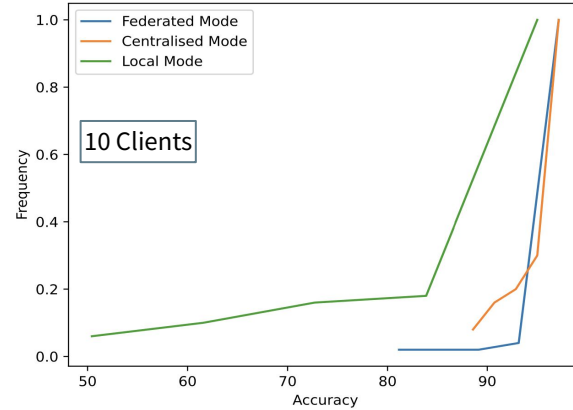

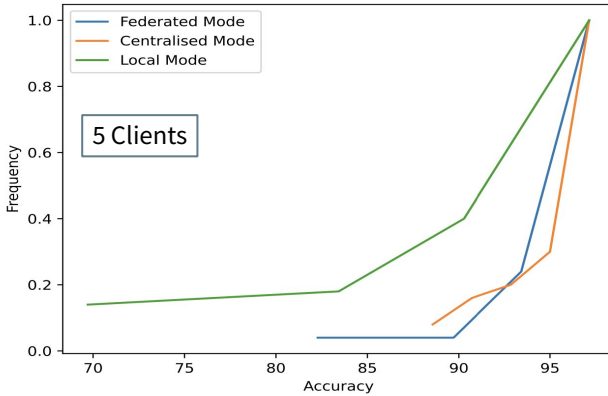

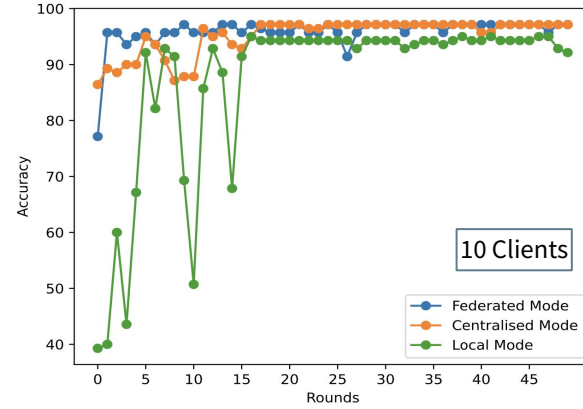

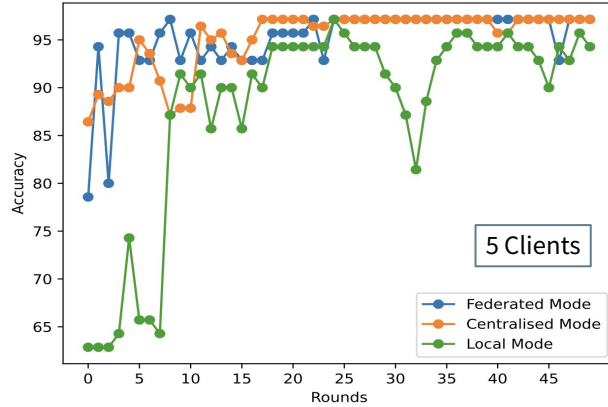

Performance Evaluation: Accuracy

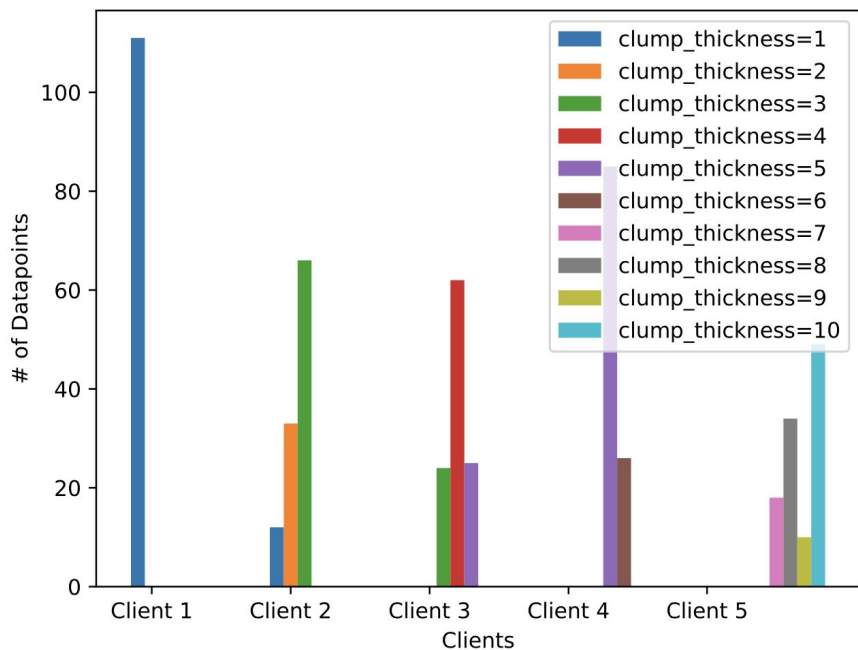

Perf Eval - Accuracy - MNIST Dataset

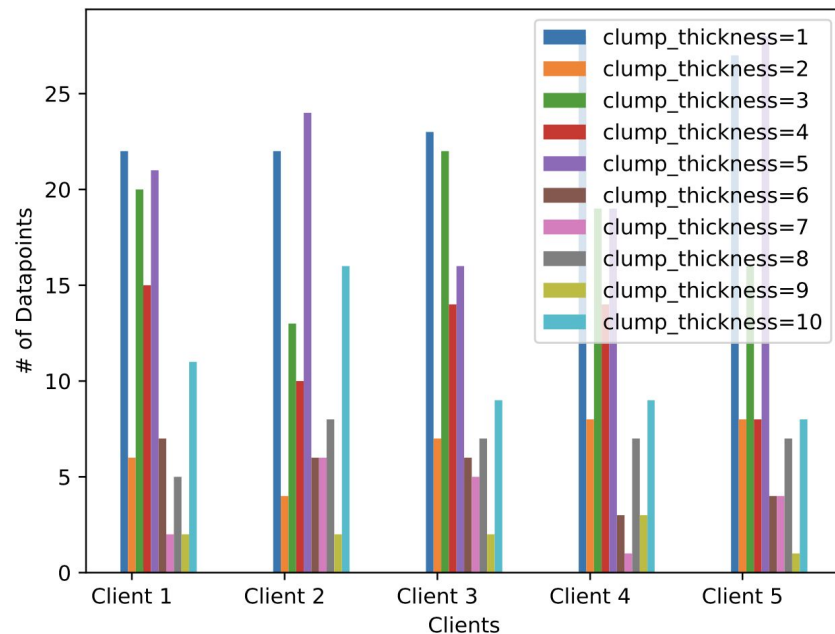

Perf Eval - Accuracy - Breast Cancer Dataset

Perf Eval - Data Distribution

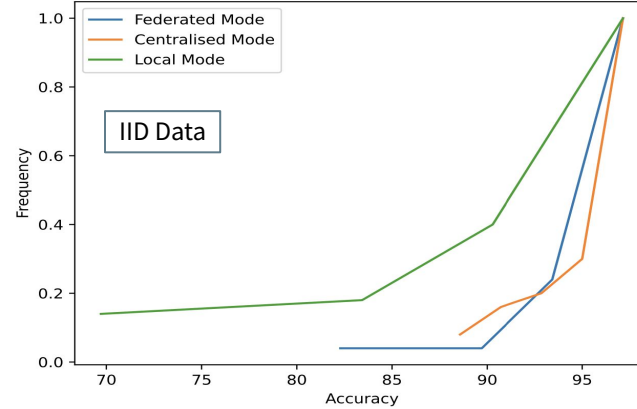

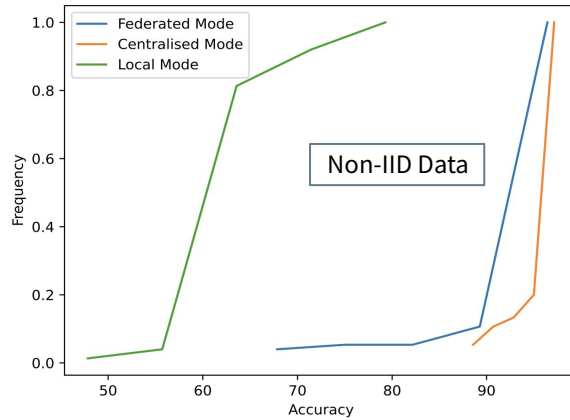

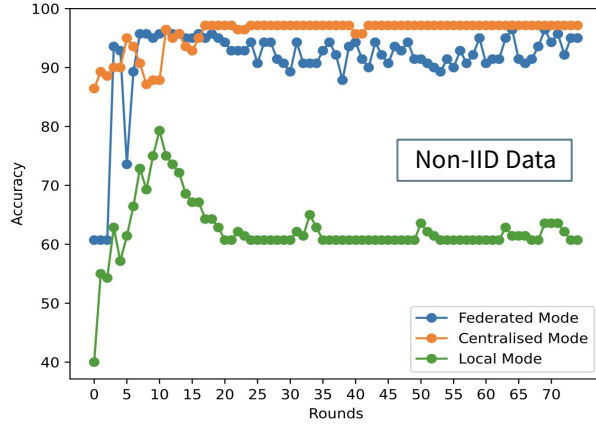

Non-IID Data Distribution

IID Data Distribution

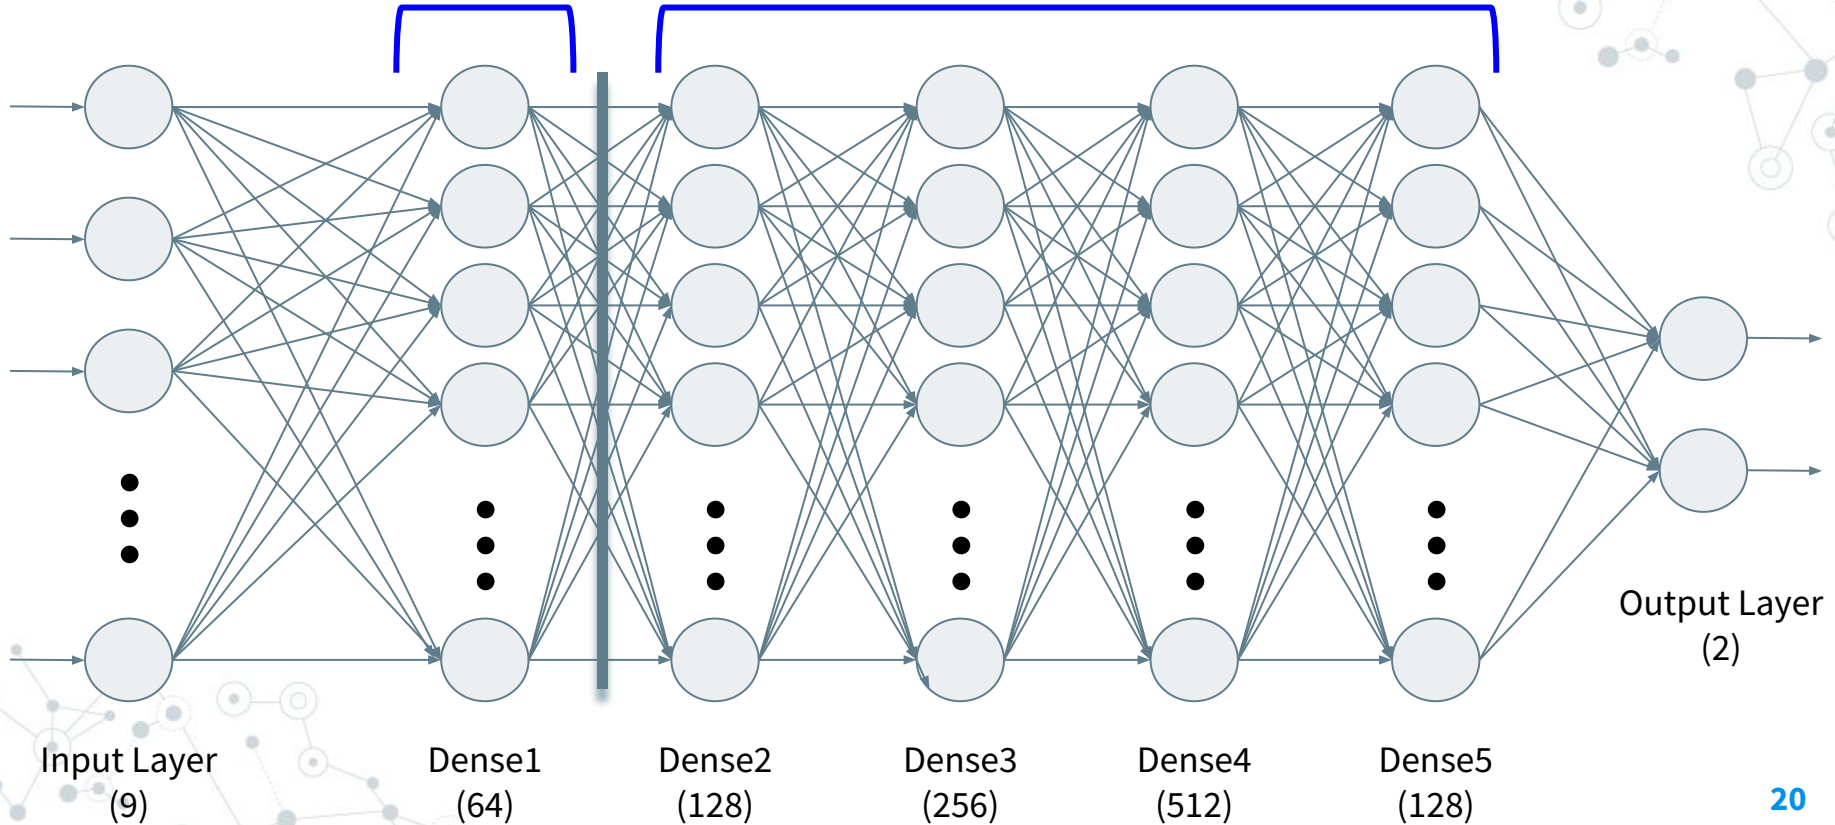

Perf Eval - Accuracy - Breast Cancer Dataset

Splitting ML Model for Breast Cancer Dataset

Client

Server

Perf Eval - Pending Results

- ⊙ Training times of each mode
- ⊙ Resource consumption when entire model is deployed
- ⊙ Resource consumption when the model is split
- ⊙ Accuracy of model in split mode vs federated mode

Limitations / Future Work

- ⊙ Algorithm to derive the split point of a model
- ⊙ Minimising processing and communication latency
- ⊙ Experiments to include more complex models, unsupervised models, larger infrastructure deployment, etc.
- ⊙ Applicable only for fully connected layers in neural network

A decorative graphic consisting of a network of nodes and connections. The nodes are represented by circles of varying sizes and colors (gray, blue, and white with a blue outline). They are interconnected by thin gray lines, forming a complex web-like structure. This graphic is positioned in the corners of the slide, with a larger concentration on the left side and a smaller one on the right side.

Thank You!
